Female ladybugs lay tiny eggs. The larva that hatches from the egg is small and long and has 6 legs.

As it rapidly grows, the larva molts (sheds its skin) several times. After reaching full size, the larva attaches itself to a plant leaf or stem (by its "tail"). The larval skin then splits down the back, exposing the pupa. The pupa is about the size of the adult but is all wrapped up, protecting the ladybug while the it undergoes metamorphosis into its adult stage. This last stage in the metamorphosis takes a few days.

# Spotlight Tool

The top and bottom of the world are called the north and south poles.

Places near the poles have very cold and snowy climates.

The top of the earth is called the Arctic.

The bottom of the earth is called Antarctica.
